Consolidated Risk Report Overview

The Consolidated Risk Report aggregates risk analysis from multiple assessments performed on the network, providing you with both a Consolidated Risk Score and a high-level overview of the health and security of the network.

The report details the scan tasks undertaken to discover security issues. In addition to the overall Consolidated Risk Score, the report also presents separate risk scores for all IT assessments (Network, Security, Exchange, SQL Server) and compliance assessments (HIPAA and PCI) performed on the network environment. This includes a summary of individual issues, as well as their severity and weighting within the risk analysis.

At the end of the report, you can find a summary of the assets discovered on the network, in addition to other useful information organized by assessment type.

Risk analysis and risk management are not one-time activities. Risk analysis and risk management are dynamic processes that must be periodically reviewed and updated in response to changes in the environment. The risk analysis will identify new risks or update existing risk levels resulting from environmental or operational changes. The output of the updated risk analysis will be an input to the risk management process to reduce newly identified or updated risk levels to reasonable and appropriate levels.

Consolidated Discovery Tasks

The following discovery tasks were performed.

Consolidated Risk Score

The Risk Score is a value from 0 to 100, where 100 represents significant risk and potential issues. The score is risk associated with the highest risk issue.

Several critical issues were identified. Identified issues should be investigated and addressed according to the Consolidated Risk Report.

Consolidated Issue Graph

This section contains a summary of issues detected during the Consolidated Assessment process, and is based on industry-wide best practices for network health, performance, and security. The Overall Issue Score grades the level of issues in the environment. An Overall Issue score of zero (0) means no issues were detected in the environment. It may not always be possible to achieve a zero score in all environments due to specific circumstances.

Asset Summary: Total Discovered Assets

Asset Summary: Active Computers

Active Computers are defined as computers that were either actively responding at the time of the scan or have checked in with Active Directory within the past 30 days.

Active Computers by Operating System

Total (710)

Operating System Support

Asset Summary: All Computers

The list of all computers includes computers that may no longer be active but have entries in Active Directory (in a domain environment).

Total Computers by Operating System

Total (1154)

Windows 10 Pro	(57.5%)
Windows 7 Professional	(26.9%)
Windows 8.1 Pro	(12.8%)
Windows Server 2003	(0.9%)
Windows Server 2008 R2 Enterprise	(0.7%)
Other	(1.1%)

Asset Summary: Inactive Computers

Inactive computers are computers that could not be scanned or have not checked into Active Directory in the past 30 days.

Inactive Computers by Operating System

Total (444)

Asset Summary: Users

Dark Web Scan Summary

The following results were retrieved using a preliminary scan of the Dark Web using a commercially available Dark Web Security tool.

Only the first 5 per domain are listed here.
